Sensory Challenges

Families living with autism spectrum disorder often look for tips on how to handle the many different challenges that may arise. “Real Life Tips for Kids with Autism” is a series of practical video’s and resources presented by the experts at Children’s Specialized Hospital.

A lot of children with autism have many sensory challenges. This could occur when they go out to a amusement park or a barbeque or even just getting a haircut. Some children can be hypersensitive. They could overreact to the situation or they could be hyposensitive, which means they’re under-reacting.

Typically we all have our five senses that we all learn back in Kindergarten, about taste, touch, smell, hearing, seeing. But there are two other senses that a lot of people forget and that’s our proprioceptive and our vestibular system. Our proprioceptive system is gonna help us organize and control our movements. So, how we walk, how we grab our pencil, how we do those big movements. Our vestibular system provides us with a sense of balance and awareness to the relationship to our environment so that keeps us steady and where we are, not bumping into objects, or bumping into people.

Some general tips to help your child to get into a new environment is preparing a schedule for them. Either you can take pictures where you are going and set up a little photo album for them. Also I know a lot of parents have ipads out there and there are wonderful apps you can set up for their schedules.

Another great tip that parents can use is to dampen the sound when you go into a movie theater or when you go into get a haircut, or going to see fireworks in the summertime or any activity, you can use these small little earplugs and just (they’re very discreet) just put them in there. Even if the child can’t tolerate both of them, just have one on and that will calm the sound down.

Another great tip for parents if you want to set them up to have a class and be more exposed to like glue and different textures, have them prepare at home. They can explore by playing rice bands or little bean bands and even play with some foods like pudding. Different textures like that will help them prepare to go into the class that they are taking or even at school so they are not so afraid when they do an art project for example, and they have to handle with glue and glitter and markers.

Another great tip for parents is to provide your child with a little sensory chest that they could take along with them anywhere that they could go – to school, to your trip. Some stuff you can include in your sensory chest, some stress reliever, like a little stress ball, like this, or even like a little squishy ball.

Some other strategies that can help children is have like a heavy backpack. They can stuff it with all the different

books, by providing this pressure, it will calm the child down. Even if your child is going to get a haircut and they need that little extra input, you can bring their stuffed animal and stuff it with some beanbags in there to provide that weight on the lap, so they don't have to move or jiggle so much and it gives them that sense of comfort, and like more awareness that they are there sitting. Some other activities that you can include in your sensory chest is just basic warm-up like jumping jacks, wall push-ups, just moving around in place, even taking a walk and just stepping out of the situation for a little bit. Another great strategy is provide snacks. Crunchy snacks like pretzels, carrots, or even chewy stuff like gum, licorice, jelly beans, but you want to stay on the healthy side.

So you can start with a gross motor activity before getting a haircut or going to the movie theater. Some of these activities can consist of doing a jumping jack or doing some wall push-ups or doing an obstacle course. Now the reason you want to do this is going to help your child organize their body, to be in a more calmer state. Also as a parent, you do want to try to get in touch with the movie theater or even if they are going to get a haircut, with the barbershop or the salon, to let them know "my child is sensitive to these sounds. Can you work with me?" Having the child maybe come a little bit earlier, or the day before, and have them even experience it, even if it is for just five minutes. This way it will decrease anxiety with you and your child. As a parent, you do want to find out more information about sensory processing – the best way to find out more information is you want to get in contact with an occupational therapist. The occupational therapist will explain the whole nervous system and how our body works with the environment. The occupational therapist will specialize in these activities and gear it towards your child because every child is completely different. So they will come up with a plan with you and your child with activities that will either clam them or get them ready for the environment.

Through occupational therapy they're gonna come up with some really fun activities. The child is not even gonna know, like "what am I doing? Oh, jumping jacks" This is making me feel great. So with them they're gonna become aware of what they dislike and what they do like. What makes them happy and what doesn't make them happy. Once these strategies are in place, you can see your child just blossom and to be able to go throughout the day without having any meltdowns. Cause not only as a parent do you know what to do, but the child is now aware of what they need to do to help them in the situation. And that's our biggest goal is to have our children to be independent.
